Abell 2192

Sensitive to the youngest stellar populations

Ancillary data

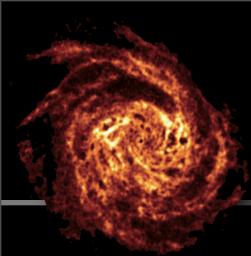

- GALEX FUV & NUV
- INT B & R imaging
- SDSS ugriz photometry (shallow)
- UKIRT zYJHK (allocated)
- Spitzer 3.6, 5.0, 24, 70 micron
- Herschel PACS & SPIRE imaging (pending)
- WIYN / WHT optical spectroscopy
- Nobeyama / LMT CO masses (pending)

ultra-deep WSRT observations

- Minimum detectable HI mass:
 $2 \times 10^9 M_{\odot}$ over 150 km/s profile width,
with 4σ in each of 3 resolution elements.
- Corresponding limiting column density:
 $3 \times 10^{19} \text{ cm}^{-2}$ over 80 km/s profile width at 7σ .

This requires: $78 \times 12^{\text{hr}}$ for A2192 at $z=0.188$
 $117 \times 12^{\text{hr}}$ for A963 at $z=0.206$

WSRT observational setup

Long-term program over 8 semesters

8x1	A963	A2192
semester	# measurements	
2005	20	15
	pilot study	
2006	33	15
	-B	5
2007	33	12
	-B	3
2008	31	8
	-B	15
rms		
~5%		
total	117	73
hours	1404	876

over 1160-1220 MHz

cone $\approx 70,000 \text{ Mpc}^3$

km/s velocity range

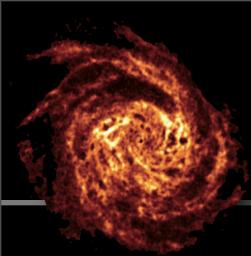

(Hanning smoothing)

on, recirculation

2 hr ‘ on Abell 2192

7 μJy ($\Delta V=80 \text{ km/s}$)

APERTIF prototype)

WSRT observational setup

Long-term program over 8 semesters

8x10MHz bands, overlapping to cover 1160-1220 MHz
 $Z = 0.164\text{-}0.224$, surveyed volume $\approx 70,000 \text{ Mpc}^3$

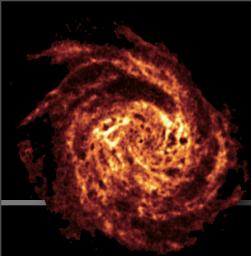

8x256 channels, covering 18,000 km/s velocity range
20 km/s velocity resolution (after Hanning smoothing)

dual polarisation, 2-bit correlation, recirculation

117x '12^{hr} ' on Abell 963, 73x '12^{hr} ' on Abell 2192

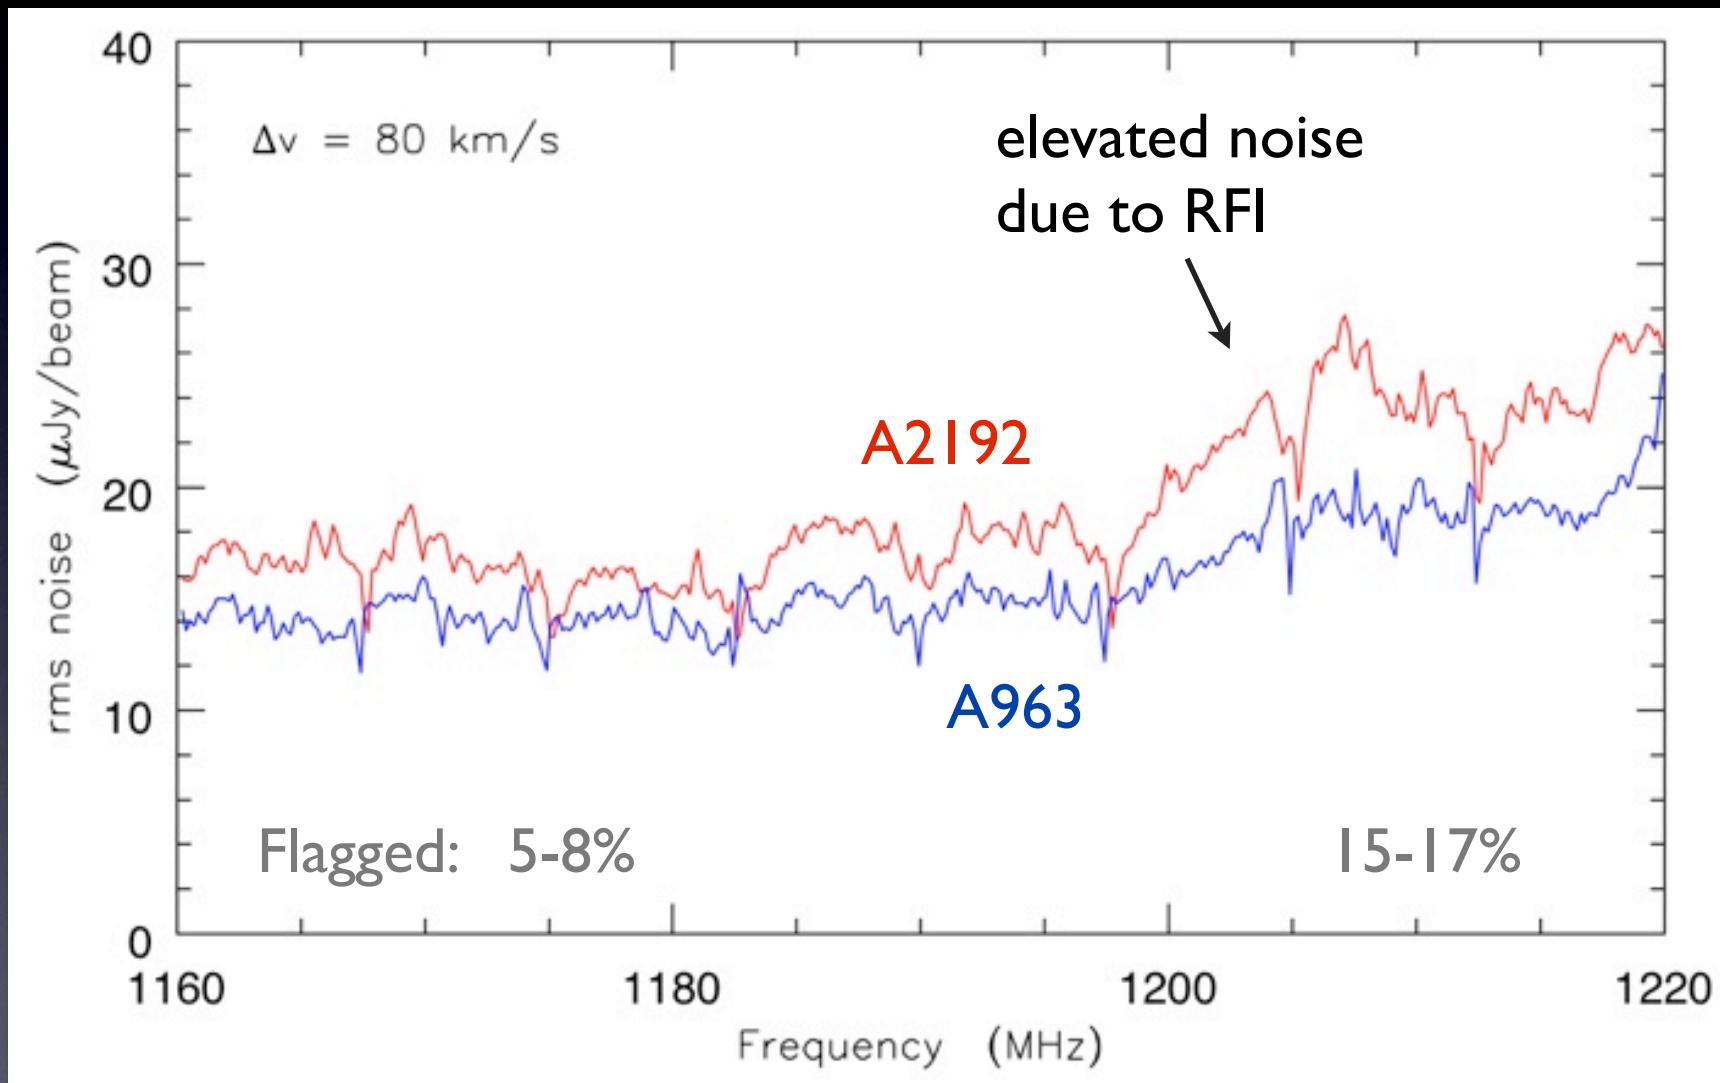

rms noise per channel: 14 μJy and 17 μJy ($\Delta V=80 \text{ km/s}$)

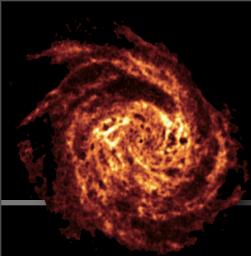

~5% lost to RFI, antenna 5 offline (APERTIF prototype)

achieved rms noise in line cubes

slightly better than predicted due to lower T_{sys} at $\nu < 1200$ MHz

continuum maps

Abell 2192

Abell 963

$\sigma = 7 \mu\text{Jy}/\text{beam}$ (confusion limited)

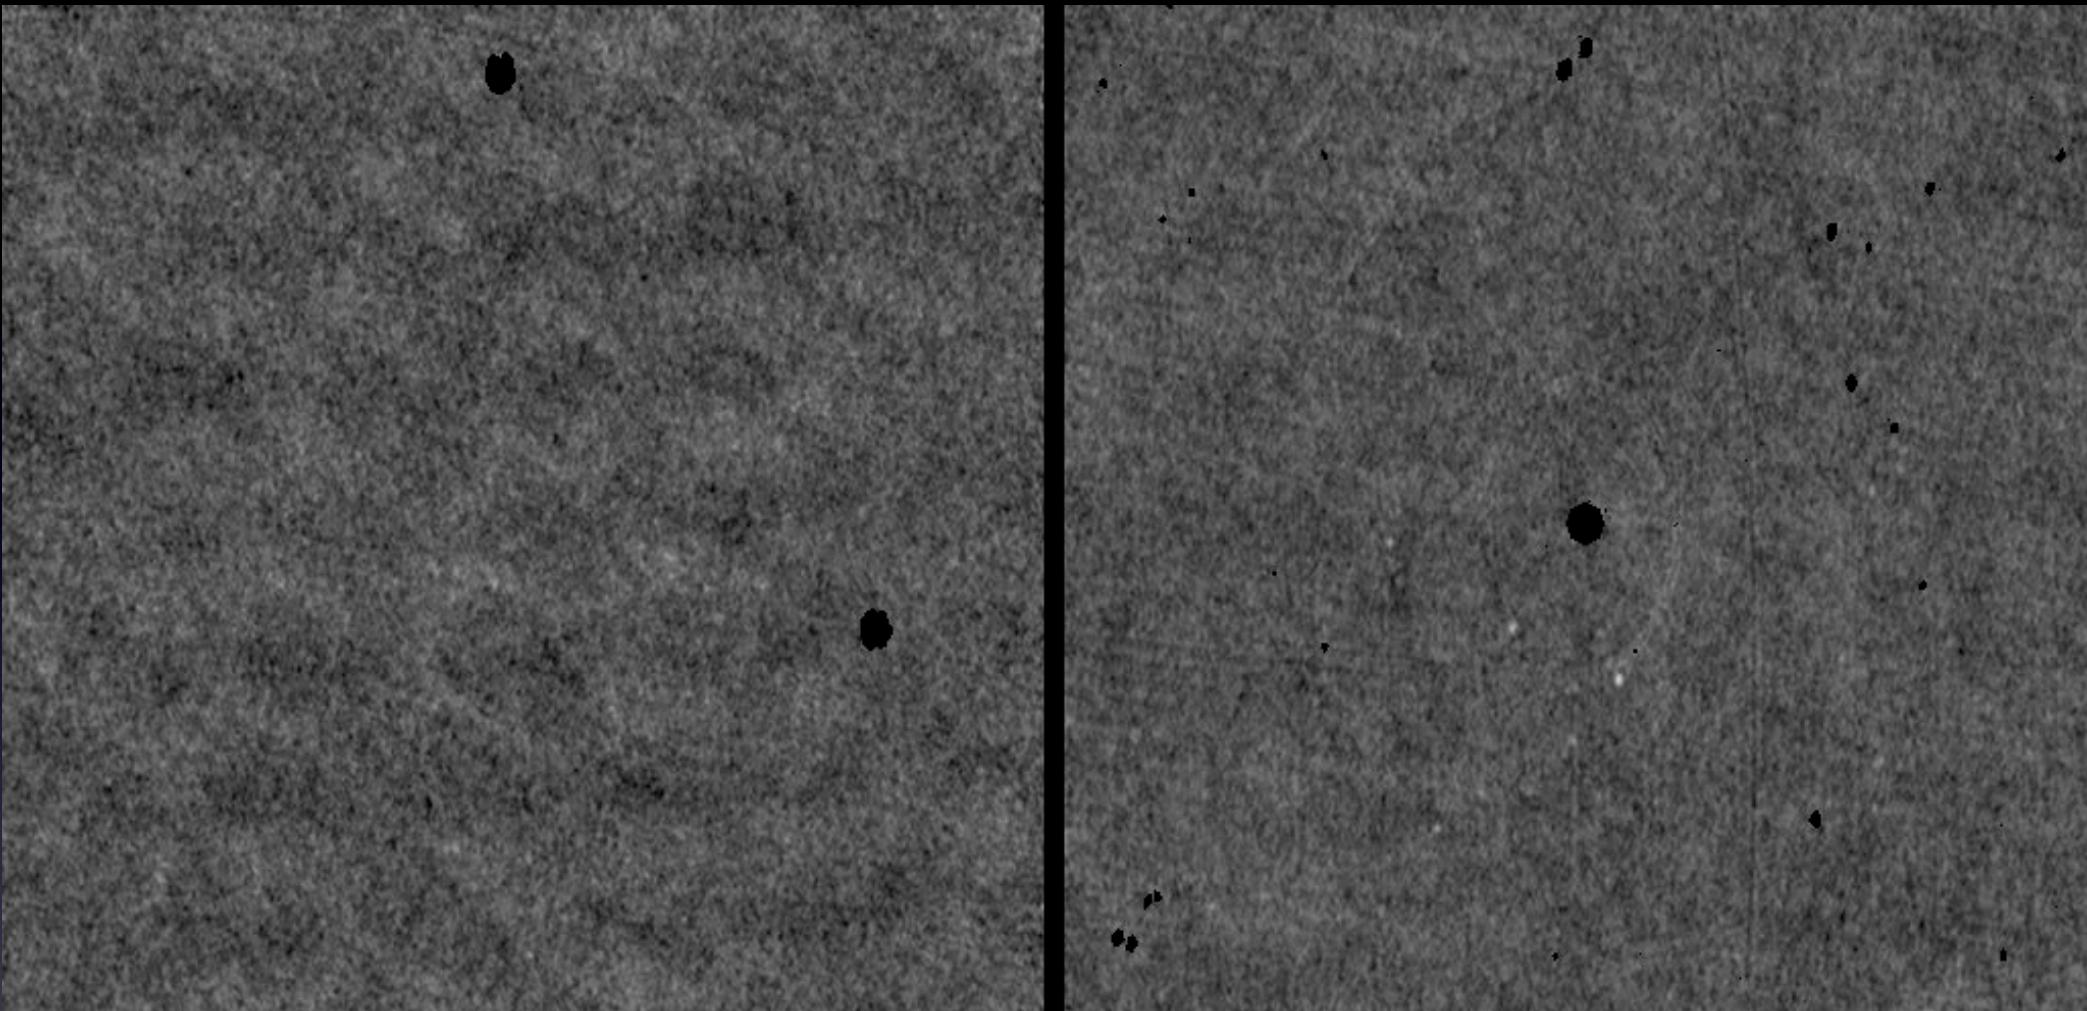

SFR $\approx 10 M_{\text{sun}}/\text{yr}$

$\sigma = \sim 12 \mu\text{Jy}/\text{beam}$ (DR limited)

(deep GALEX data more sensitive)

Abell 2192

Abell 963

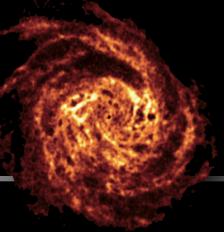

$\sigma = 17 \mu\text{Jy}/\text{beam}$

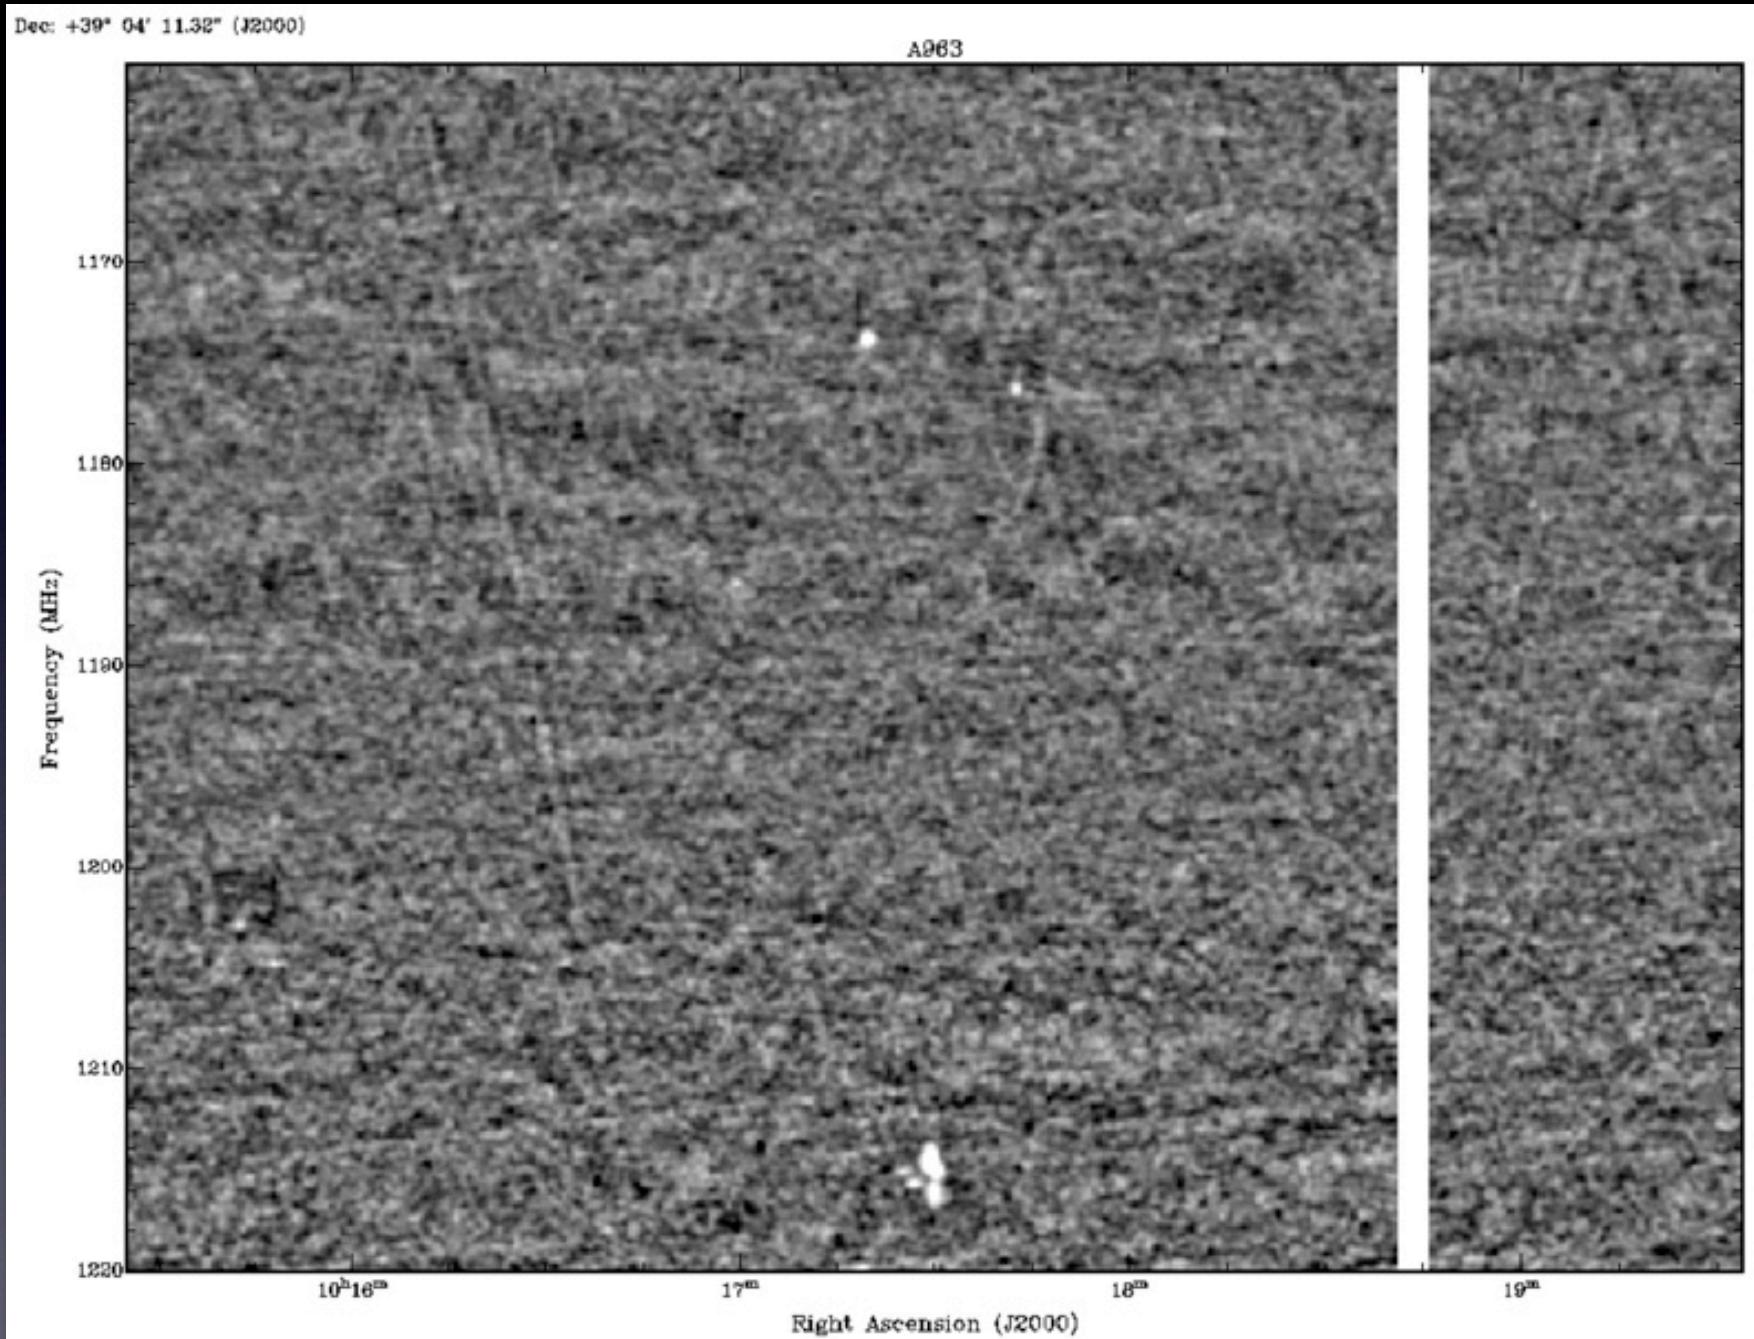

$\Delta V = 80 \text{ km/s}$

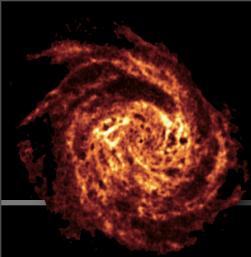

$\sigma = 14 \mu\text{Jy}/\text{beam}$

Detection criteria: 1 $\times 8\sigma$,
or 1.5 $\times 6\sigma$,
or 2 $\times 5\sigma$,
or 3 $\times 4\sigma$ in N consecutive spectral resolution elements.

photometry
(InterRest)

M_{star} from BRI
photometry and
Zibetti models.

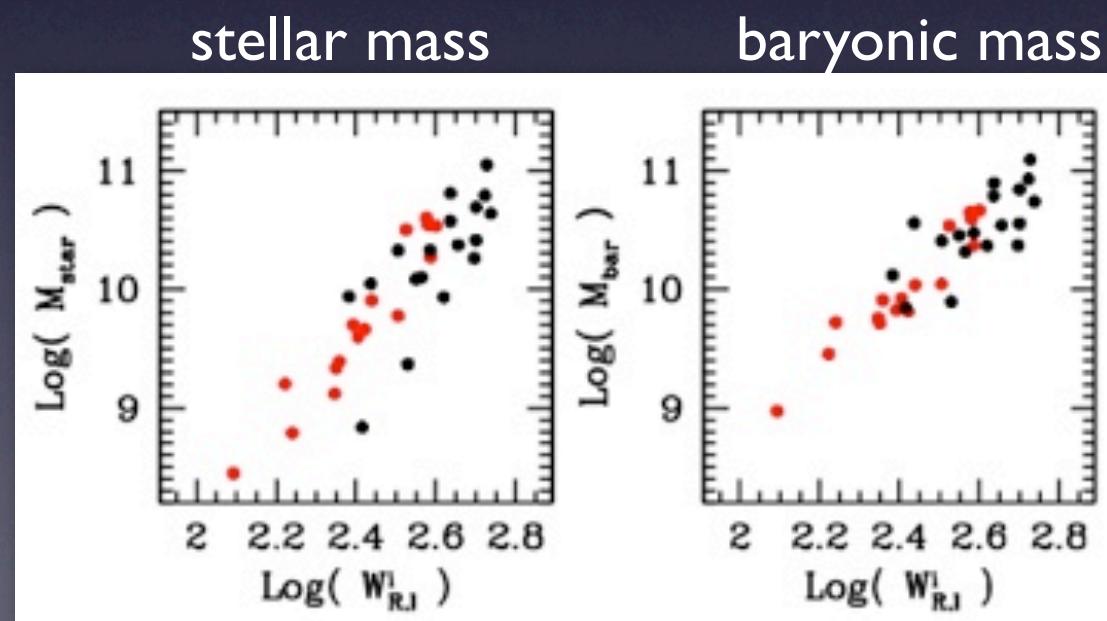

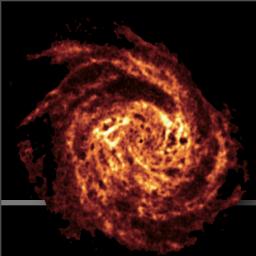

TF relations - z=0 vs z=0.2

- larger scatter
- no appreciable offset

error/statistical
analysis is pending

summary & outlook

Expected rms achieved, but significant imaging artifacts

HI emission from ~ 140 individual galaxies at $Z \approx 0.2$

Blind HI survey uncovers LSS not seen by SDSS

Blue ‘BO-galaxies’ gas-poor wrt similar field galaxies

$TF_{Z=0.2} \approx TF_{Z=0}$

Characterization of environments is ongoing

Collection and compilation of ancillary data is ongoing
