INTERFEROMETER 14.2 METER DIGITAL DATA LINK

Dwayne R. Schiebel

Introduction

The Digital Data Link consists of two systems: one which is located in Green Bank and one which is located on Point Mountain about 32 kilometers from Green Bank. A radio link enables digital data to be transmitted and received from the remote antenna. The DDP 116 can then read the received data or send data to the remote antenna.

Programming

To initiate a data transfer the link will interrupt the DDP 116 on interrupt line 14 (interrupt location 45). This interrupt should occur ten times a second. When the link receives data from the remote antenna the computer will be interrupted. Should the radio link drop out the computer will still receive a interrupt, but it will not be able to input data. When the DDP 116 receives the interrupt it has a maximum of 90 ms to output a commanded position and read thirteen words of data from the 14.2 m telescope.

INA 1017 Inputs up to thirteen data words received from the remote antenna. See Table I for format.

OTA 117 Outputs telescope commanded position. See Table V for format.

SKS 17 Skip if DDP 116 can input data.

SKS 117 Skip if DDP 116 can output data.

TABLE I

Bit Format Data from 14.2 m

Word	Function	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	Range	Resolution
1	Indicated	φ	A														B	360° — 4.943 s	4.94385 s
2	Azimuth	φ	C			D													
3	Indicated	φ	A														B	360° — 4.943 s	4.94385 s

D = 00:00: 4.9

Electronics

The electronics can be divided into two systems. One system is the "Green Bank" system which sends 128 bits of information and receives 160 bits of information from the 14.2 m telescope. The other system is the "14.2 meter" system; it sends 160 bits of information to Green Bank and receives 128 bits of information.

A block diagram is provided for each system. This diagram could be used for quick reference to identify a particular card associated with its input or output data.

In general, the transmit section of each system contains a long shift register which is loaded with either digital data or some analog voltage converted-to-digital form. The conversion, loading and shifting is controlled by the card in slot 7. The receive section is a long shift register and data latch. The output data from this section will be in either digital or analog form. The receive section is also controlled by the card in slot 7.

Most cards in the system need no explanation. In the Green Bank system two busses are used: one to pass data to the DDP 116 (INBxx) and the micro bus which passes the data to the micro-processor. The 14.2 m system only has the micro bus.

One card worthy of note is the 14.2 m receive card, bits 1-48. This card converts the difference between commanded and indicated positions to an analog voltage. The list below is a rough estimate of voltage out for difference in.

Commanded 2.8° > indicated ... +10 V out

Commanded 2.8° < indicated ... -10 V out

For differences less than 2.8° the output will be about 4.88 mV for each 4.94 seconds of difference.

The microprocessor card is used to control two front panel displays which are provided to display data from both the transmit and receive sections of a system. The desired data display is selected by a digi-switch. A microprocessor (Motorola 6809) reads data in the shift registers and displays it in a meaningful format. The microprocessor card is the only card common to both systems except for the program stored in PROM's.

Microprocessor Program

This program reads the data in the shift registers and converts it to decimal or hexadecimal data to be displayed in the displays. Each display has an associated digit-switch to inform the program which data is requested. (See Table X.)

In addition to displaying data, the program checks four words of position (indicated at GB and commanded at 14.2 m) for a most significant bit to be zero. If they are all zero, the program will set a data OK flip flop. This data OK, in addition to a hardware detection of sync enables data to be output from the link to the telescope and front end controls.

A special diagnostic mode can be entered by setting digi-switch A to 1F. In this mode, display A contains the number of data errors the program found since this counter was last reset. A plus sign in this display indicates that the counter has overflowed. Digi-switch B controls data that is displayed in display B and resets the block and error counters. Digi-switch B functions in the following manner:

Digi-Sw B = 00-0F	Displays last bad data block bits 1-120 in 8 bit chunks.
Digi-Sw B = 10	Resets error and block counters.
Digi-Sw B = 11	Displays receive block count; updates 10 times a second.

The indicated and commanded positions are displayed in hexadecimal. In order to be able to interpret this data, Appendix B is supplied to convert the two most significant bits to degrees, minutes, and seconds.

Tables VI and VII contain a card list for each system and Table VIII and IX are lists of particular bits used by the Green Bank system to control the front end and the telescope at Monterville.

Appendix A contains data sheets for the A/D and D/A used in these systems.

TABLE VI
Green Bank System

Slot	Function
4	Microprocessor card.
5	Transmit bits 49-128, 4 A/D channels, single bit data from control panel and front end and TTL data.
6	Transmit bits 1-48, commanded azimuth and elevation positions. Also interfaces with the DDP 116.
7	Transmit/receive control and bi-phase generator and decoder.
8	Receive bits 105-160, coarse indicated AZ/EL positions (in BCD), TTL data from 14.2 m, and one fast analog channel from 14.2 m.

APPENDIX A

- (1) Analog Devices Data Sheet, AD570, "Low Cost, Complete IC, 8-Bit A to D Converter".

- (2) Data Sheet HS DAC80, "Complete 12-Bit D/A Converter".

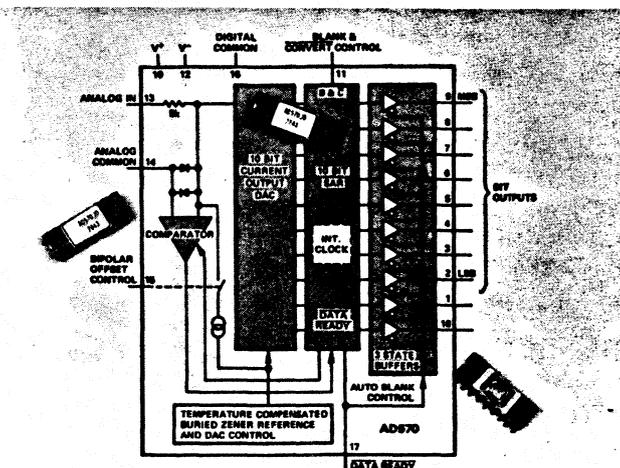

Low Cost, Complete IC 8-Bit A to D Converter

AD570*

FEATURES

- Complete A/D Converter with Reference and Clock
- Fast Successive Approximation Conversion – 25 μ s
- No Missing Codes Over Temperature
 - 0 to +70°C – AD570J
 - 55°C to +125°C – AD570S
- Digital Multiplexing – 3 State Outputs
- 18 Pin Ceramic DIP
- Low Cost Monolithic Construction

PRODUCT DESCRIPTION

The AD570 is an 8-bit successive approximation A/D converter consisting of a DAC, voltage reference, clock, comparator, successive approximation register and output buffers – all fabricated on a single chip. No external components are required to perform a full accuracy 8-bit conversion in 25 μ s.

The AD570 incorporates the most advanced integrated circuit design and processing technology available today. I²L (integrated injection logic) processing in the fabrication of the SAR function along with laser trimming of the high stability SiCr thin film resistor ladder network at the wafer stage (LWT) and a temperature compensated, subsurface Zener reference insures full 8-bit accuracy at low cost.

Operating on supplies of +5V and -15V, the AD570 will accept analog inputs of 0 to +10V unipolar or \pm 5V bipolar, externally selectable. As the BLANK and CONVERT input is driven low, the three state outputs will be open and a conversion will commence. Upon completion of the conversion, the DATA READY line will go low and the data will appear at the output. Pulling the BLANK and CONVERT input high blanks the outputs and readies the device for the next conversion. The AD570 executes a true 8-bit conversion with no missing codes in approximately 25 μ s.

The AD570 is available in two versions; the AD570J is specified for the 0 to 70°C temperature range, the AD570S for -55°C to +125°C. Both guarantee full 8-bit accuracy and no missing codes over their respective temperature ranges and are packaged in 18-pin hermetically-sealed ceramic DIP's.

PRODUCT HIGHLIGHTS

1. The AD570 is a complete 8-bit A/D converter. No external components are required to perform a conversion. Full scale calibration accuracy of \pm 0.8% (2LSB of 8 bits) is achieved without external trims.
2. The AD570 is a single chip device employing the most advanced IC processing techniques. Thus, the user has at his disposal a truly precision component with the reliability and low cost inherent in monolithic construction.
3. The AD570 accepts either unipolar (0 to +10V) or bipolar (-5V to +5V) analog inputs by simply grounding or opening a single pin.
4. The device offers true 8-bit accuracy and exhibits no missing codes over its entire operating temperature range.
5. Operation is guaranteed with -15V and +5V supplies. The device will also operate with a -12V supply.
6. The AD570S is also available with full processing to MIL-STD-883B, Class B. The single chip construction and functional completeness make the AD570 especially attractive for high reliability applications.
7. Every AD570 is subjected to long-term stabilization bakes, given a powered burn-in at +125°C, and temperature cycled ten times from -65°C to +150°C prior to final test to insure reliability and long-term stability. In addition, all units are tested 100% at the extremes of their respective temperature ranges for all parameters to guarantee full performance.

Complete 12-Bit D/A Converter

FEATURES

- Low Cost
- 12-Bit Resolution
- Fast-Output Settling
- $\pm 1/2$ LSB Linearity
- Voltage or Current Output
- TTL and CMOS Compatible
- Wide Operating Supply Range

DESCRIPTION

HS DAC80 is a low cost, general purpose 12-bit digital to analog converter. It consists of matched bipolar switches, a precision network, a low drift reference and a fast settling output amplifier (V Model only). The inputs are complementary-binary coded and can be driven by either TTL or CMOS logic up to +15 Volt. The input thresholds are standard TTL.

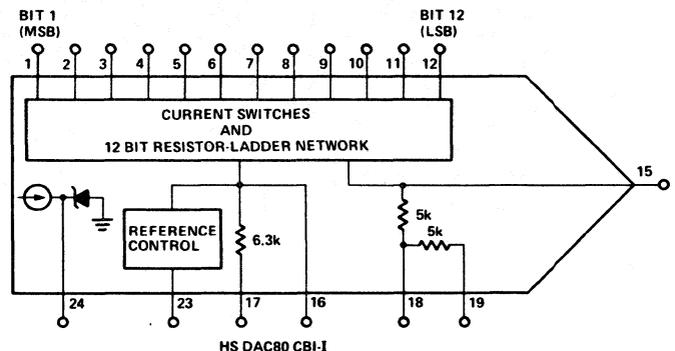

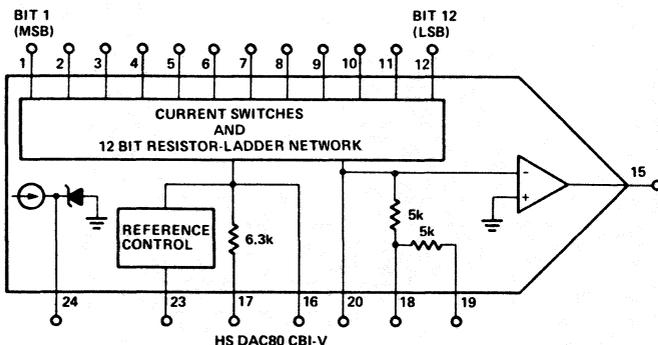

HS DAC80 comes in two versions, a voltage output model (HS DAC80-CBI-V) with pin programmable output ranges of $\pm 2.5V$, $\pm 5V$, $\pm 10V$, 0 to +5V and 0 to +10V, and a current output model (HS DAC80-CBI-I) with output ranges of either $\pm 1mA$ or 0 to -2mA.

Centerpiece of the HS DAC80 is a bipolar monolithic fast settling MDAC. Special buffers are connected to its inputs for TTL and CMOS input compatibility. A low current, low drift, temperature compensated reference diode acts as voltage reference for the MDAC, and includes a control circuit which provides a gain adjustment feature.

The on-chip thin film resistor ladder network is actively laser trimmed for output linearity error of less than 1/2 LSB. Output offset, gain and range scaling resistors are all factory trimmed for optimum performance.

HS DAC80 is packaged in a proprietary ceramic/plastic compound 24-pin DIP. The patented design of this package offers greatly increased sealing surface compared to "glued on lid" type packages; is leakproof, and will withstand all usual environmental hazards in its 0 to +70°C operating temperature range. In addition, no internal wires or components are in contact with any resins or epoxy, with substantial improvement in reliability as a result.

FUNCTIONAL DIAGRAMS

SPECIFICATIONS

($T_A = +25^\circ\text{C}$, rated power supplies unless otherwise noted)

MODEL	HS DAC80-CBI
--------------	---------------------

DIGITAL INPUT	
Resolution	12-Bits
Coding	Complementary Binary/Offset Binary
Logic Levels	
Logical "1" (at $+1\mu\text{A}$)	+2V DC min, +15V DC max
Logical "0" (at $-100\mu\text{A}$)	0V DC min, +0.8V DC max

ACCURACY	
Linearity Error	$\pm 1/4\text{LSB typ, } \pm 1/2\text{LSB}^1 \text{ max}$
Differential Linearity Error	$\pm 1/2\text{LSB typ, } \pm 3/4\text{LSB max}$
Gain Error ²	$\pm 0.1\% \text{ typ, } \pm 0.3\% \text{ max}$
Offset Error ²	$\pm 0.05\% \text{ FSR typ, } \pm 0.15\% \text{ FSR}^3 \text{ max}$
Monotonicity Temp. Range	0 to $+70^\circ\text{C}$
DRIFT⁴ (0 to $+70^\circ\text{C}$)	

Total Bipolar Drift (Includes Gain, Offset, and Linearity Drifts)	$\pm 25\text{ppm FSR}/^\circ\text{C max}$
Total Error Over 0 to $+70^\circ\text{C}^5$	
Unipolar	$\pm 0.08\% \text{ FSR typ, } \pm 0.15\% \text{ FSR max}$
Bipolar	$\pm 0.06\% \text{ FSR typ, } \pm 0.12\% \text{ FSR max}$
Gain	$\pm 15\text{ppm}/^\circ\text{C typ, } \pm 30\text{ppm}/^\circ\text{C max}$
Exclusive of Internal Ref.	$\pm 10\text{ppm}/^\circ\text{C max}$
Unipolar Offset	$\pm 1\text{ppm FSR}/^\circ\text{C typ, } \pm 3\text{ppm FSR}/^\circ\text{C max}$
Bipolar Offset	$\pm 7\text{ppm FSR}/^\circ\text{C typ, } \pm 15\text{ppm FSR}/^\circ\text{C max}$
Differential Linearity Error	
0 to $+70^\circ\text{C}$	$+1, -7/8 \text{ LSB max}$
Linearity Error	
0 to $+70^\circ\text{C}$	$\pm 1/2 \text{ LSB max}$

CONVERSION SPEED/V Models	
Settling Time to $\pm 0.01\%$ of FSR For FSR Change with $10\text{k}\Omega$ Feedback	$5\mu\text{s typ}$
with $5\text{k}\Omega$ Feedback	$3\mu\text{s typ}$
For 1 LSB Change	$1.5\mu\text{s typ}$
Slew Rate	$10\text{V}/\mu\text{s min, } 18\text{V}/\mu\text{s typ}$
CONVERSION SPEED/I Models	
Settling Time to $\pm 0.01\%$ of FSR For FSR Change	
10 to 100Ω Load	300ns typ
$1\text{k}\Omega$ Load	$1\mu\text{s typ}$

ANALOG OUTPUT/V Models	
Ranges	$\pm 2.5\text{V, } \pm 5\text{V, } \pm 10\text{V, } 0 \text{ to } +5\text{V, } 0 \text{ to } +10\text{V}$
Output Current	$\pm 5\text{mA min}$
Output Impedance (DC)	$0.05\Omega \text{ typ}$
Short Circuit Duration	Indefinite to Common
ANALOG OUTPUT/I Models	
Ranges	$\pm 1\text{mA, } 0 \text{ to } -2\text{mA typ}$
Output Impedance - Bipolar	$3.2\text{k}\Omega \text{ typ}$
Output Impedance - Unipolar	$6.6\text{k}\Omega \text{ typ}$
Compliance	$\pm 2.5\text{V}$

INTERNAL REFERENCE VOLTAGE	
Tempco of Drift	$\pm 10\text{ppm}/^\circ\text{C typ, } \pm 20\text{ppm}/^\circ\text{C max}$
External-Use Current ⁶	$\pm 200\mu\text{A max}$

POWER SUPPLY SENSITIVITY	
+15V Supply	$\pm 0.02\% \text{ FSR}/\% V_S \text{ max}$
-15V Supply	$\pm 0.002\% \text{ FSR}/\% V_S \text{ max}$

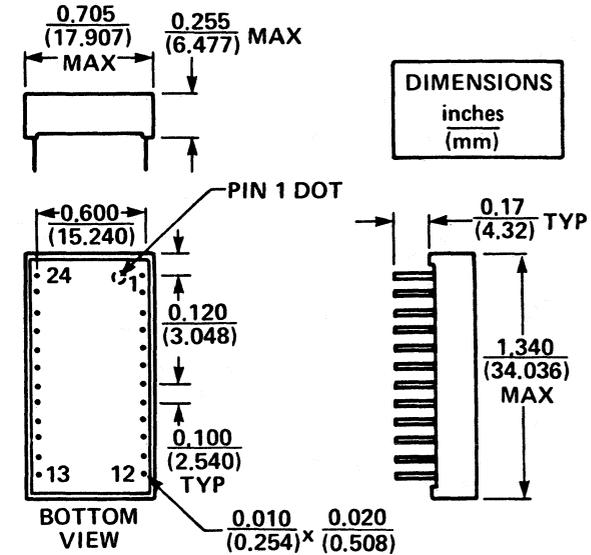

POWER SUPPLY REQUIREMENTS⁷	
DAC80	$\pm 8\text{V DC min, } \pm 15\text{V DC typ, } \pm 16\text{V DC max}$
Supply Drain	
+15 (Including 5mA Load)	30mA max
-15 (Including 5mA Load)	20mA max
+5V (Logic Supply)	Not required

TEMPERATURE RANGE	
Operating	0 to $+70^\circ\text{C max}$
Storage	$-55^\circ\text{C to } +85^\circ\text{C}$

NOTES

- Least Significant Bit (LSB).
- Adjustable to zero with external trim potentiometer.
- FSR means "Full Scale Range" and is 20V for $\pm 10\text{V}$ range, 10V for $\pm 5\text{V}$ range, etc.
- To maintain drift spec internal feedback resistors must be used for current output models.
- With gain and offset errors adjusted to zero at $+25^\circ\text{C}$.
- Maximum with no degradation of specifications with constant load.
- Power supply sensitivity may increase substantially at minimum supply voltages.
